

Chapter 11. Reproductive System

PAGE NO : 141

Solution 1:

1. Testes
2. Ovary
3. Uterus
4. Oviduct
5. Fertilization
6. Parthenogenesis
7. Testes and ovaries

Solution 2:

1. penis
2. vagina
3. oviduct
4. female
5. oviduct

Solution 3:

1. Ovary: To produce ova and three female sex hormones i.e oestrogen, progesterone and relaxin.
2. Fallopian tube: To transport eggs from ovary to uterus and it a site of fertilization.
3. Uterus: To protect and provide nutrients for the developing embryo.
4. Vagina: To receive the seminal fluid.
5. Testes: To produce sperms and male sex hormone i.e. testosterone.
6. Penis: deposition of semen into the female's vagina.

Solution 4:

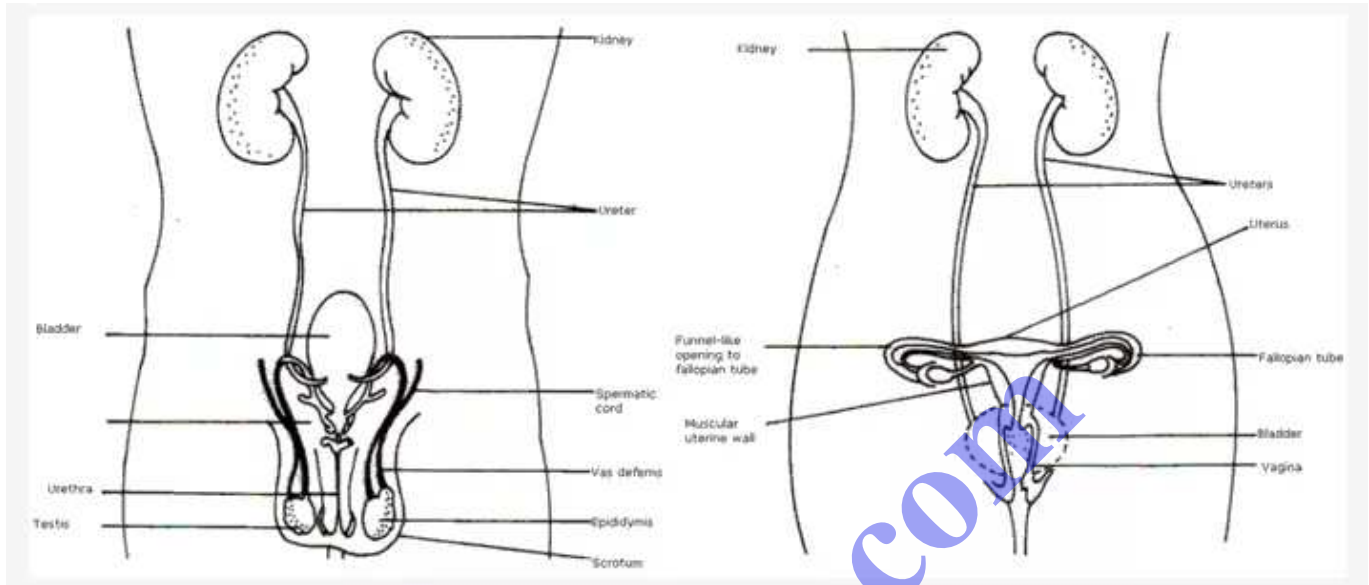

1. Parthenogenesis: It is a type of asexual reproduction in which a female gamete or egg cell develops into an individual without fertilization.
2. Asexual reproduction: It is the type of reproduction in which the offspring are formed without the production of gametes.
3. Sexual reproduction: It is the type of reproduction in which the offspring are formed after the fusion of gametes.
4. Dioceious: It is the individual / organism having male and female reproductive organs in separate individuals.
5. Monoecious: It is the individual / organism having male and female reproductive organs in the same individual.
6. Clone: It is a group of genetically identical cells or organisms asexually descended from a common ancestor.

Solution 5:

1. Parturition: The expulsion of the foetus from the mother's body is called parturition.

2. Ovulation: The process of release of an egg from the ovary is called ovulation.
3. Spermatogenesis: The production and development of sperms is called spermatogenesis.
4. Gestation: The period in which an embryo develops in the uterus is called gestation.
5. Implantation: The attachment of developing zygote to the uterine wall is called implantation.

Solution 6:

PAGE NO : 142

Solution 7:

1. Graafian follicle
2. Uterus
3. Ovulation is the process of releasing of egg from the ovary.
4. The hormones secreted by the ovary are: oestrogen and progesterone.

Solution 8:

1. Peritoneum
2. Ureter
3. Backbone
4. Rectum
5. Seminal vesicle
6. Glands
7. Anus
8. Vas deferens
9. Epididymis
10. Left testis
11. Scrotum
12. Penis
13. Urethra
14. Vascular erectile tissue
15. Bladder

16. Muscular wall of abdomen

The two functions of part 6 are :

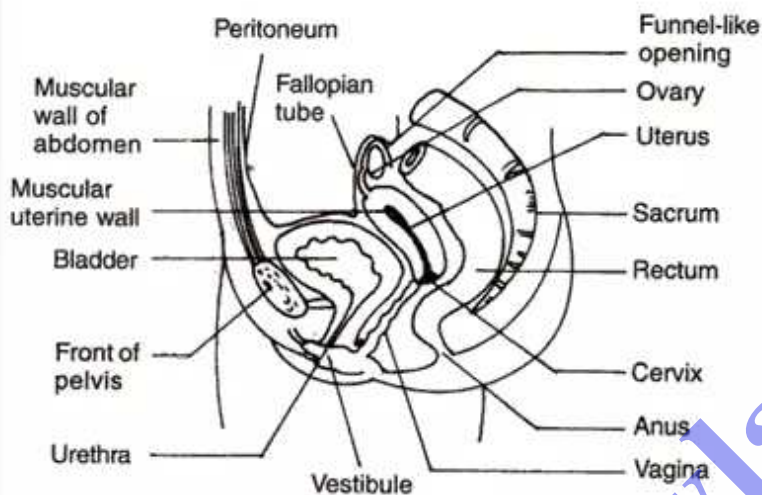

- Prostate gland secretes an alkaline milky secretion into semen that aids in sperm motility.
- Cowper's gland also secretes a lubricant.

17. The three components of urine are urea, uric acid, amino acids, glucose, sodium, potassium, vitamins etc.

18. The main function of the part labelled 3 is backbone. Its function is to give support, movement and protection to the spinal cord.

Solution 9:

(i)

(ii) If fertilization takes place then, the wall of uterus thickens and is supplied with blood capillaries.

If fertilization do not takes place then, the endometrium breaks down and causes the discharge of blood and mucus.

Solution 10:

1. Graafian follicle
2. Seminal vesicles and prostate gland
3. Uterus
4. Parturition
5. Oviduct

PAGE NO : 143

Solution 11:

1. Fallopian tube
2. Funnel like opening
3. Uterus
4. Sacrum
5. Rectum

6. Cervix
7. Anus
8. Vagina
9. Front of pelvis
10. Bladder
11. Muscular uterine wall
12. Muscular wall of abdomen
13. Peritoneum
14. Normally, after 28 days an ovary releases an egg.
15. During coitus, sperm are released in the vagina.
16. After ejaculation in vagina, sperms undergo fertilization where it fuses with an ovum of female to form zygote.
17. The function of sacrum is to protect the pelvic organs or reproductive organs of female.
18. The gestation period in human is 280 days.

Solution 12:

1. False
2. False
3. True
4. False
5. True

Solution 13:

False.

Pregnancy in women can be prevented by the method of tubectomy.

Solution 14:

Amnion.

Solution 15:

1. Menarche
2. Ovulation
3. Menstruation
4. Fertilization
5. Implantation

Solution 16:

1. (b) continuity of race
2. (b) asexual reproduction
3. (b) female gamete
4. (c) Parthenogenesis
5. (b) vagina
6. (c) castration
7. (b) oviduct
8. (c) puberty
9. (b) menarche
10. (c) 20-30C below the body temperature
11. (d) menarche
12. (b) 10 days
