

# RD Sharma Class 7 Solutions chapter-20 Mensuration-I Exercise-20.1

## Exercise-20.1.

Solution 1:-

(i) we have,

$$\text{Length} = 5.5\text{m} \text{ and, Breadth} = 2.4\text{m}$$

WKT,

$$\text{Area of a rectangle} = \text{Length} \times \text{Breadth}.$$

$$\therefore \text{Area of a rectangle} = 5.5\text{m} \times 2.4\text{m}$$
$$= 13.2\text{ m}^2$$

(ii) we have,

$$\text{Length} = 180\text{cm}, \text{ Breadth} = 150\text{cm}$$

$$\text{we know that, } 1\text{m} = 100\text{cm} \Rightarrow 1\text{cm} = \frac{1}{100}\text{m}$$

$$\text{Length} = 180\text{ cm} = 180 \times \frac{1}{100}\text{ m} = 1.8\text{m}$$

$$\text{Breadth} = 150\text{cm} = 150 \times \frac{1}{100}\text{ m} = 1.5\text{m}$$

$$\text{Area of a rectangle} = \text{Length} \times \text{Breadth},$$
$$= 1.8\text{m} \times 1.5\text{m}$$
$$= 2.7\text{ m}^2$$

$$\therefore \text{Area of a rectangle} = 2.7\text{ m}^2$$

Solution-2 :-

(i) we have,

$$\text{side of the square} = 2.6\text{cm}.$$

$$\text{we know that, Area of a square} = \text{side} \times \text{side} = (\text{side})^2$$

$$\therefore \text{Area of the square} = 2.6\text{cm} \times 2.6\text{cm}$$
$$= 6.76\text{cm}^2$$

$$\text{Area of the square} = 6.76\text{cm}^2$$

(ii) we have,

$$\text{side of the square} = 1.2\text{dm}.$$

$$\text{we know that, } 1\text{dm} = 10\text{cm} \quad [\text{dm} \rightarrow \text{decimeter}]$$

$$\therefore \text{Area of the square} = (\text{side})^2$$

$$\text{Side of the square} = 1.2\text{dm} = 1.2 \times 10\text{cm}$$
$$= 12\text{cm}$$

$$\therefore \text{Area of the square} = 12\text{cm} \times 12\text{cm}$$
$$= 144\text{cm}^2.$$

Solution-5 :-

(i) we have,

$$\text{Length} = 125\text{m}, \text{Breadth} = 40\text{m}.$$

Area of a rectangular field in hectares = ?

We know that,

$$1 \text{ hectare} = 10^4 \text{ m}^2 = 10,000 \text{ m}^2.$$

$$\begin{aligned}\therefore \text{Area of a rectangular field} &= \text{Length} \times \text{Breadth} \\ &= 125\text{m} \times 40\text{m} \\ &= 50,000 \text{ m}^2.\end{aligned}$$

$$1 \text{ m}^2 = \frac{1}{10,000} \text{ hectares.}$$

$$\therefore \text{Area of a rectangular field} = \frac{50,000 \times 1}{10,000} \text{ hectares.}$$

$\therefore$  Area of a rectangular field = 5 hectares.

(ii) we have, Length = 75m 5dm = 75m + 5 × 10cm.

$$\begin{aligned}&= 75\text{m} + 50\text{cm} = 75\text{m} + \frac{50}{100}\text{m} \\ &= 75.5\text{m}.\end{aligned}$$

$$\text{Breadth} = 12\text{m}.$$

$$\begin{aligned}\therefore \text{Area of a rectangular field} &= \text{Length} \times \text{Breadth} \\ &= 75.5\text{m} \times 12\text{m} \\ &= 906 \text{ m}^2.\end{aligned}$$

$$\text{We know that, } 1 \text{ m}^2 = \frac{1}{10,000} \text{ hectares.}$$

$$\therefore \text{Area of a rectangular field} = \frac{906}{10,000} \text{ hectares.}$$

$\therefore$  Area of a rectangular field = 0.0906 hectares.

Solution-06 :-

Given that,

Door of length = 3m and Breadth = 2m.

Wall of Length = 10m and Breadth = 10m.

$$\begin{aligned}\text{Area of Door} &= \text{Length} \times \text{Breadth of door} \\ &= 3\text{m} \times 2\text{m} = 6 \text{ m}^2\end{aligned}$$

$$\begin{aligned}\text{Area of Wall} &= \text{Length of Wall} \times \text{Breadth of Wall} \\ &= 10\text{m} \times 10\text{m} = 100 \text{ m}^2\end{aligned}$$

$$\begin{aligned}\text{Area of Painting Wall} &= \text{Area of Wall} - \text{Area of Door} \\ &= 100 \text{ m}^2 - 6 \text{ m}^2 = 94 \text{ m}^2.\end{aligned}$$

$$\text{Cost of Painting Wall} = 94 \times \text{Rs } 2.50$$

$$[\because \text{Cost per } \text{sq.m.} \text{ Painting} = \text{Rs } 2.50]$$

$$\therefore \text{Cost of Painting Wall} = 94 \times 2.50 = \text{Rs } 235$$

Solution-07:-

It is given that,

Rectangular shaped wire of Length = 40cm and Breadth = 22cm.

Given that Perimeter of Rectangle = Perimeter of square.

$\therefore$  A wire is in the shape of rectangle is bent in square [Shape].

$$\Rightarrow 2(l+b) = 4(\text{side}) \\ \Rightarrow 2(40+22) = 4(\text{side}) \Rightarrow 124\text{cm} = 4(\text{side}) \\ \Rightarrow \text{side} = 31\text{cm.}$$

Area of square =  $(31)^2 = 961\text{cm}^2$  [ $\because A = (\text{side})^2$ ]

Area of Rectangle =  $40 \times 22 = 88\text{cm}^2$  [ $\because A = l \times b$ ].

$\therefore$  Square encloses more area.

Solution-08:-

It is given that,

Window, pane of dimensions Length = 25cm.  
Breadth = 16cm.

$$\therefore \text{Area of pane} = \text{pane Length} \times \text{pane Breadth} \\ = 25\text{cm} \times 16\text{cm} \\ = 400\text{cm}^2 \\ = 400 \times \frac{1}{10,000} \text{m}^2 \\ = \frac{400}{10,000} \text{m}^2 \\ = 0.04\text{m}^2.$$

$$\therefore \text{Area of window} = 12 \times \text{Each pane Area} \\ = 12 \times 0.04\text{m}^2 = 0.48\text{m}^2$$

$\therefore$  glass will be required for a window =  $0.48\text{m}^2$

Solution-09:-

It is given that,

Marble Length = 10cm and Breadth = 12cm.

Wall of Length = 3m and Breadth = 4m.

$$\therefore \text{Area of Marble tile} = \text{Length of tile} \times \text{Breadth of tile} \\ = 10\text{cm} \times 12\text{cm} = 120\text{cm}^2 \\ = 0.012\text{m}^2 \quad [\because \text{cm}^2 = \frac{1}{10,000}\text{m}^2]$$

$$\therefore \text{Area of Wall} = 3\text{m} \times 4\text{m} = 12\text{m}^2$$

$$\therefore \text{No. of tiles required} = \frac{\text{Area of Wall}}{\text{Area of Marble tile}} = \frac{12}{0.012} = 1000 \text{ tiles.}$$

Total cost of the tiles for covering of wall =  $1000 \times 2\text{Rs} = \text{Rs}2,000$

### Solution-10:-

Given that,

$$\text{Table top} = 9\text{dm } 5\text{cm} = 9 \times 10\text{cm} + 5\text{cm} = 95\text{cm}.$$

$$\text{Table Long} = 6\text{dm } 5\text{cm} = 6 \times 10\text{cm} + 5\text{cm} = 65\text{cm}.$$

$$\begin{aligned}\text{Area of Table} &= \text{Table Top} \times \text{Table Long} \\ &= 95\text{cm} \times 65\text{cm} \\ &= 6175\text{cm}^2.\end{aligned}$$

$$\text{Cost to polish table} = 6175 \times 20 \text{ paise}$$

$$[\because \text{cost per Sq.cm Polish} = 2 \text{ paise}]$$

$$\begin{aligned}\therefore \text{cost to polish Table} &= 6175 \times 20 \text{ paise} \\ &= \text{Rs. } 1235.\end{aligned}$$

$$[\because 1 \text{Rs} = 100 \text{ paise}]$$

### Solution-11:-

It is Given that,

$$\text{Room Length} = 9.68\text{m and Breadth (wide)} = 6.2\text{m}.$$

$$\text{Rectangular tile of Length} = 22\text{cm}.$$

$$\text{Breadth} = 10\text{cm}.$$

$$\text{Cost per tile} = \text{Rs } 2.50.$$

$$\text{Area of Room} = 9.68 \times 6.2 \text{ m}^2 = 60.016 \text{ m}^2$$

$$\begin{aligned}\text{Area of Rectangular tile} &= 22\text{cm} \times 10\text{cm} = 220\text{cm}^2 \\ &= 0.022 \text{ m}^2\end{aligned}$$

$$\begin{aligned}\text{No. of tiles} &= \frac{\text{Area of Room}}{\text{Area of Rectangular tile}} = \frac{60.016 \text{ m}^2}{0.022 \text{ m}^2} \\ &= 2728 \text{ tiles.}\end{aligned}$$

$$\therefore \text{Cost of the tiles} = 2728 \times \text{Rs } 2.50 = \text{Rs. } 6820$$

### Solution-12:-

Given square field of side = 179m.

$$\begin{aligned}\text{Area of square field} &= 179 \text{ m} \times 179 \text{ m.} \\ &= 32041 \text{ m}^2\end{aligned}$$

Cost of Raising a lawn on the field =

$$\text{Rs } 1.50 \text{ per Sq.m.}$$

$$\begin{aligned}\text{Total cost of Raising of a lawn on the field} &= 32041 \times 1.5 \\ &= \text{Rs } 48,061.50 \text{ paise.}\end{aligned}$$

$$\therefore \text{Total cost} = \text{Rs } 48,061.50.$$

### Solution-14:-

Given that,

$$\text{corridor of a school Length} = 8\text{m}.$$

$$\text{Breadth} = 6\text{m}.$$

$$\text{Canvas sheet Length} = 2\text{m}.$$

$$\text{Breadth} = 1\text{m}.$$

$$\begin{aligned}\text{Area of a corridor} &= L \times B = 8\text{m} \times 6\text{m} \\ &= 48 \text{ m}^2.\end{aligned}$$

$$\text{Canvas sheet Area} = 2\text{m} \times 1\text{m} = 2 \text{ m}^2.$$

$$\begin{aligned}\text{No. of sheets} &= \frac{\text{Area of corridor}}{\text{Canvas sheet Area}} = \frac{48 \text{ m}^2}{2 \text{ m}^2} \\ &= 24\end{aligned}$$

$$\begin{aligned}\text{Cost of the canvas sheets req. to cover the} \\ \text{corridor} &= 24 \times \text{Rs. } 8 = \text{Rs. } 192.\end{aligned}$$

Solution-15:-

given  
play ground Length = 62m 60cm =  $62 + \frac{60}{100}$  m  
 $= 62.6\text{ m}.$

Breadth = 25m 40cm =  $25 + \frac{40}{100}$  m  
 $= 25.4\text{ m}.$

Area of a play ground =  $62.6 \times 25.4 = 1590.04\text{ m}^2$

cost of turfing =  $1590.04 \times 2.5 = \text{Rs } 3975.$

Perimeter of a play ground =  $2(62.6 + 25.4) = 176\text{ m}.$

Perimeter of 8 times round the field =  $8 \times 176\text{ m} = 528\text{ m}$

And he walks 2m/sec.

Time =  $\frac{528}{2} = 264\text{ seconds} = 4\text{ min } 24\text{ seconds.}$

Solution-16:-

Lane length = 180m and Breadth = 5m.

Bricks of Length = 20cm and Breadth = 15cm.

Area of a Lane =  $180\text{ m} \times 5\text{ m} = 900\text{ m}^2$

Area of a Brick =  $20\text{ cm} \times 15\text{ cm} = 300\text{ cm}^2$   
 $= \frac{300}{10,000} \text{ m}^2 = 0.03\text{ m}^2$

No. of Bricks =  $\frac{\text{Area of Lane}}{\text{Area of Brick}} = \frac{900}{0.03}$   
 $= 30,000.$

Total cost of Bricks =  $30 \times \text{Rs } 750$

$= \text{Rs } 2,25,00$  [∴ Cost per  
1000 bricks  
 $= \text{Rs } 750].$

Solution-17:-

sheet of Paper Length = 125cm & Breadth = 85cm.

Piece of Paper of size Length = 17cm & Breadth = 5cm

Sheet of Paper Area =  $125\text{ cm} \times 85\text{ cm}.$

Piece of Paper Area =  $17\text{ cm} \times 5\text{ cm}.$

No. of envelopes =  $\frac{\text{Sheet of Paper Area}}{\text{Piece of Paper Area}}$   
 $= \frac{125\text{ cm} \times 85\text{ cm}}{17\text{ cm} \times 5\text{ cm}} = 125\text{ cm}.$

∴ 125cm of envelopes can be made out of a sheet.

Solution-18:-

The width of a cloth = 170cm.

Length of a cloth = ? = l

No. of diapers = 25.

Piece of cloth Length = 50cm and

Breadth = 17cm.

No. of diapers =  $\frac{\text{Area of a cloth}}{\text{Area of a piece of cloth}}$

25 =  $\frac{170\text{ cm} \times l}{50\text{ cm} \times 17\text{ cm}}$

$\frac{25 \times 50\text{ cm}}{10} = l \Rightarrow l = 125\text{ cm}.$

Solution 21 :-

Given dimensions of a hall

$$\text{length} = 36 \text{ m} = l$$

$$\text{breadth} = 24 \text{ m} = b$$

And also given area of doors and windows =  $80 \text{ m}^2$

Let 'h' be the height of the hall.

Area of papering the hall

$$= l \times h + l \times h + b \times h + b \times h - \{\text{area of Windows and doors}\}$$

$$= (2l \times h + 2b \times h + 2lh - 80) \text{ m}^2$$

$$= 2 \times h (36 + 24) - 80$$

$$= (120h - 80) \text{ m}^2$$

$$\therefore \text{Total area of papering} = (120h - 80) \text{ m}^2.$$

We have

Cost of papering the walls per  $1 \text{ m}^2$  = Rs 8.40

Cost of papering the walls = Rs. 9408.

From this, we get

$$\text{Total area of papering} (\text{in } \text{m}^2) = \frac{\text{Rs } 9408}{\text{Rs } 8.40}$$

$$= 1120 \text{ m}^2$$

$$\text{But we have, Total area} = (120h - 80) \text{ m}^2$$

$$\therefore 120h - 80 = 1120$$

$$120h = 1200$$

$$\Rightarrow h = \frac{1200}{120} = 10 \text{ m}$$

$$\therefore \text{Height of the hall} = 10 \text{ m}.$$

# chapter-20 Mensuration-I

## Exercise-20.2

Exercise-20.2.

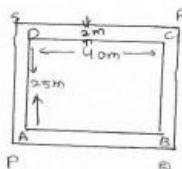

Solution-01:-

Let ABCD be the grassy lawn, and let PQRS be the external boundaries of the path. We have,

$$\text{Length of AB} = 40\text{m}$$

$$\text{Breadth of BC} = 25\text{m}$$

$$\begin{aligned}\text{Area of Lawn ABCD} &= 40 \times 25\text{m}^2 \\ &= \frac{1000}{600}\text{m}^2\end{aligned}$$

$$\text{Length of PQ} = (40+2+2)\text{m}$$

$$\text{Breadth of QR} = (25+2+2)\text{m}$$

$$\begin{aligned}\therefore \text{Area of PQR} &= 44 \times 29\text{m}^2 \\ &= 1276\text{m}^2\end{aligned}$$

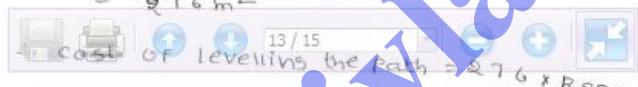

NOW,

Area of the path

$$= \text{Area of PQR} - \text{Area of ABCD}$$

$$= (1276 - 1000)\text{m}^2$$

$$= 276\text{m}^2$$

RS 2277

Solution-02:-

Let ABCD be the square park and let PQR be the internal boundaries of the path. We have,

$$\text{Length AB} = 30\text{m} = \text{Side AB}$$

$$\text{Length PQ} = 30\text{m} - 2\text{m}$$

$$= 28\text{m} = \text{Side PQ}$$

$$\text{Area of ABCD} = 30\text{m} \times 30\text{m}$$

$$= 900\text{m}^2$$

$$\text{Area of PQR} = 28\text{m} \times 28\text{m}$$

$$= 784\text{m}^2$$

Total cost = RS 1176.

$$\text{Cost per sq.m} = \frac{\text{RS 1176}}{\text{Area}}$$

$$= \frac{\text{RS 1176}}{784}$$

$$= \text{RS. 1.5 per sq.m.}$$

Solution-04:-

Rectangular sheet

$$\text{Length} = 100 \text{ cm}$$

$$\text{Breadth} = 80 \text{ cm}$$

$$\text{Area} = 100 \times 80 \text{ cm}^2$$
$$= 8000 \text{ cm}^2$$

Square of side = 10 cm

$$\text{Area of square} = 10 \times 10 \text{ cm}^2$$
$$= 100 \text{ cm}^2$$

$$\text{Area of 4 squares} = 4 \times 100 \text{ cm}^2$$
$$= 400 \text{ cm}^2$$

$$\text{Area of Remaining sheet} = \text{Area of rect} - 4 \times \text{Area of one square}$$
$$= 8000 \text{ cm}^2 - 400 \text{ cm}^2 = 7600 \text{ cm}^2$$
